In addition to a heart-healthy lifestyle, medications to lower

At least 1 in 3 people will experience a heart attack or stroke that

Ezetimibe

Eating a healthy diet, filled with vegetables, fruit, whole grains,

Knowing your ASCVD risk, LDL-C and blood pressure numbers is

Taking a higher intensity (dose) of statin will lower LDL-C

Once statin therapy is maximized, some high risk patients

Let’s take a look at the

Bile acid sequestrants

The more LDL-C is reduced

Why Is Taking Medication Important?

• In addition to a heart-healthy lifestyle, medications to lower your LDL-C level will reduce your ASCVD risk.
• Taking a higher intensity (dose) of statin will lower LDL-C more, and prevent more ASCVD events, than a lower dose. Most patients can tolerate higher intensities (doses) of statin.
• Once statin therapy is maximized, some high risk patients may benefit from further lowering their LDL-C with a nonstatin medication such as ezetimibe, a PCSK9 inhibitor or a bile acid sequestrant. High risk patients include those who have had more than one heart attack, stroke or other ASCVD event, those with ASCVD and multiple risk factors, or those with familial hypercholesterolemia with ASCVD or other risk factors.

Approximate LDL-C Lowering Effect*:

The SHARED approach was created to help facilitate the SDM process, which can help improve patient outcomes, rates of self-management, satisfaction with care, and lower healthcare costs.

Artherosclerotic Cardiovascular Disease (ASCVD) develops due to a buildup of sticky, cholesterol-rich plaque. Over time, plaque can harden and narrow your arteries. ASCVD causes heart attacks, strokes, symptoms from blocked arteries, and death.

You might have been hospitalized for an ASCVD event. Or, you might have risk factors that put you at increased risk of ASCVD. LDL-C, blood pressure, smoking and diabetes are all risk factors that can be treated to reduce your ASCVD risk.

Healthy lifestyle habits are the foundation for preventing risk factors and ASCVD events. With increasing age or higher risk factor levels, medications such as statins are often needed to be added to reduce the risk of an ASCVD event and death.

**What is ASCVD?**

**How do I know if I have ASCVD or am at risk for ASCVD?**

**What can I do about it?**

**Are there any side effects?**

**What would treatment look like for me?**

**How long do we try? How will I know if what I am doing is making a difference?**

**What if I have challenges sticking to my goals? What resources are available to help me?**

Why Is A Heart-Healthy Lifestyle Important?

• At least 1 in 3 people will experience a heart attack or stroke that will cause death or damage to their heart or brain.
• Eating a healthy diet, filled with vegetables, fruit, whole grains, and limiting sweets and red meats; exercising; maintaining a healthy weight; and not smoking, help reduce your risk for heart attack, stroke, and death and other health conditions.

• Knowing your ASCVD risk, LDL-C and blood pressure numbers is important; and can help your care team best assess whether the therapy is working for you.

• Knowing your ASCVD risk, LDL-C and blood pressure numbers is important; and can help your care team best assess whether the therapy is working for you.
**Assess Your Patient’s Values and Preferences**

**Questions to Ask About Treatment:**

Will these treatments work for me?
- Statins have been studied in clinical trials in 200,000+ people over 30 years and have been shown to be safe and effective in preventing cardiovascular (CV) disease.
- Large reductions in LDL-C result in large reductions in CV risk.
- If you do not already have an ASCVD diagnosis, and are not sure about taking a statin, a Coronary Artery Calcium (CAC) score may better guide your decision.

Are there side effects to the medications or anything else I should know?
- Some people who take statins will experience muscle aches; but most muscle symptoms are not related to statin therapy. Stopping and retrying statins, under medical supervision, can help determine if symptoms are related to treatment.
- If you experience rhabdomyolysis symptoms (severe muscle pain or weakness, or dark/decreased urination), a very rare side effect, stop your statin and call me right away.
- There are seven statins available. Usually you can find one that works for you with no or minimal side effects.
- The benefit of statins for reducing heart attack and stroke risk outweighs the small excess risk of diabetes associated with taking them.
- We can also take a look at the potential out-of-pocket costs of therapies.

**Reach a Decision With Your Patient**

**My Treatment Plan**

Date: ________________  
For the next _____ months

Heart-Healthy Diet goals: ______________________________________________________  
Exercise goals: ______________________________________________________________  
Other risk factor goals: ________________________________________________________  

<table>
<thead>
<tr>
<th>Medication:</th>
<th>Dose Frequency</th>
<th>Lab test:</th>
<th>Next appointment:</th>
</tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

It is recommended that you aim to maintain statin treatment in some form. However, the decision of whether to continue taking the statin is up to the patient.

The symptoms that I’m experiencing while taking my statin(s) include:
- Muscle aches in my legs, trunk, shoulders, or upper arms
- Muscle weakness
- Other: ______________________________

On a scale from 1 to 10, with 1 being hardly noticeable, to 10 entirely negatively impacting my daily routine, I rate my symptoms as a __________.

Are these symptoms tolerable?  Y  |  N

Is my ability to exercise limited by these symptoms?  Y  |  N

**Evaluate Your Patient’s Decision**

What are the benefits of sticking with my treatment plan?
- ____________________________________________________________

What might get in the way of achieving my goals and what can we do about that?
- ____________________________________________________________

**Decide Which Local Resources Will Effectively Support Your Patient and How To Connect**
